

BICYCLE CONTROL CABLE FIXING DEVICE

ABSTRACT OF THE DISCLOSURE

[0082] A control cable fixing device is coupled to a bicycle component such as a rear derailleur in order to secure an inner wire of a control cable to the bicycle component. The control cable fixing device includes a support member with a first engagement surface and a cable fixing member with a second engagement surface. The cable fixing member is rotatable relative to the support member. The cable fixing member and the support member secure the inner wire between the engagement surfaces in response to rotational movement of the cable fixing member to a cable fixing position. The cable fixing member preferably includes a cam portion and a lever portion that is manually operable to rotate the cable fixing member.
